

# Towards carbon storage in concrete - Mg-based binders

13.3.2024

Prof. Päivö Kinnunen  
Oulun Yliopisto

# Inorganic circular materials group

Associate professor (tenure track)  
Juho Yliniemi

Associate professor (tenure track)  
Tero Luukkonen

Senior Researcher  
Priya(dharshini)  
Perumal

Professor  
Mirja  
Illikainen

Professor  
Päivö Kinnunen

Senior research fellow  
Katja Ohenoja

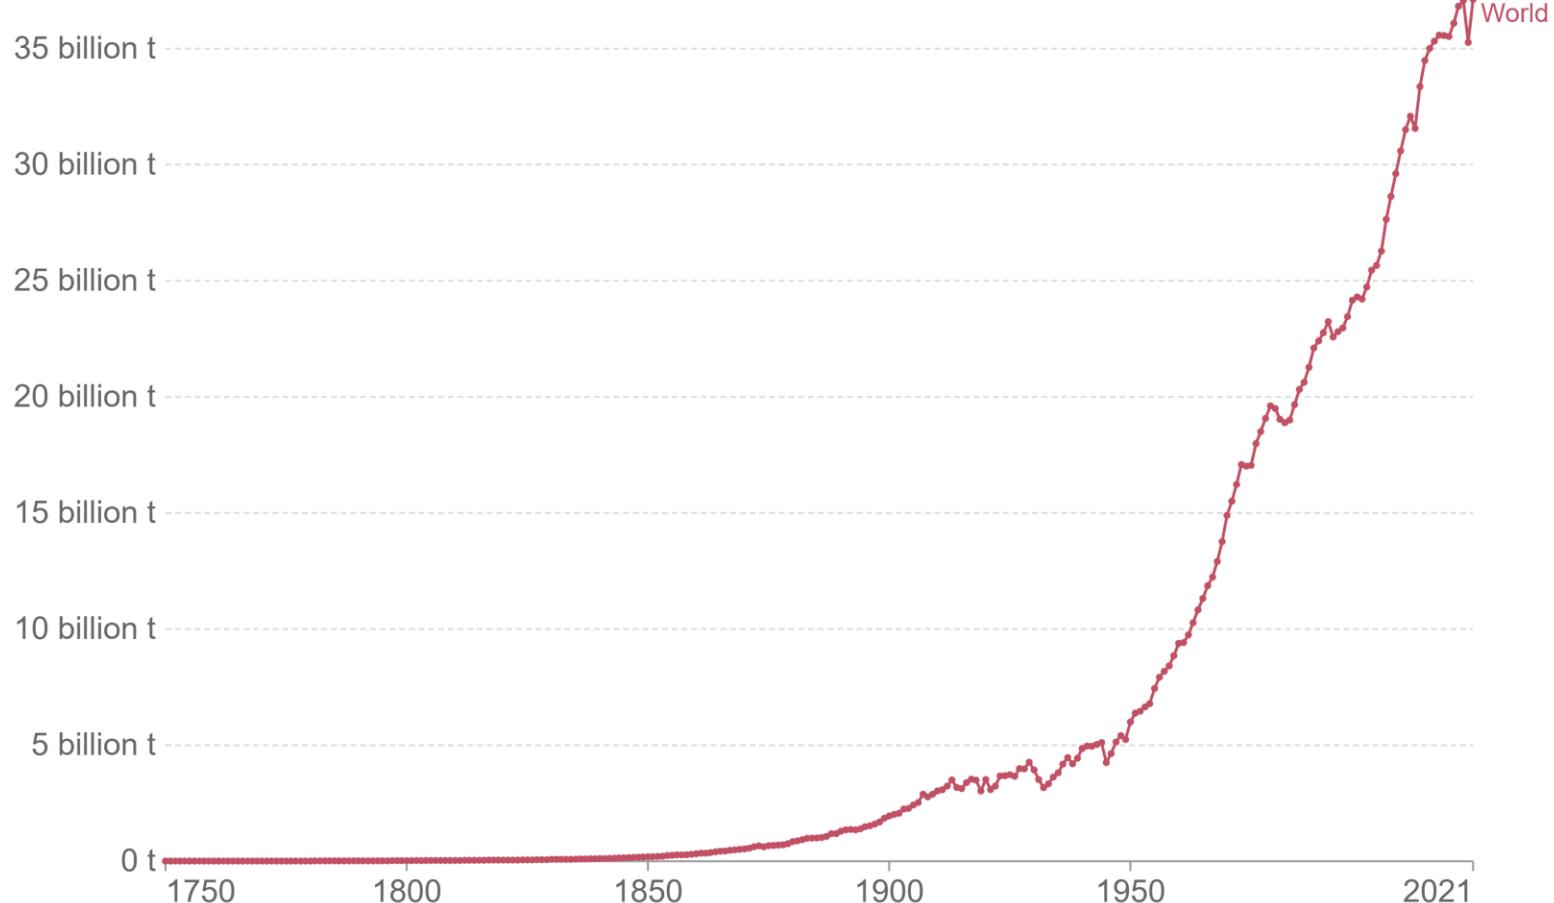

- 4 professors (2 associate/assistant), 2 senior research fellows
- 8 postdocs, 28 doctoral researchers
  - Master students, trainees, laboratory technicians
- Budget: ~3 M€/year
- External funding: >80 %
  - EU Horizon, Business Finland, Academy of Finland, Private foundations, ERDF, direct company projects
- **Topics:**
  - Utilization, characterization, and processing of industrial inorganic side streams
  - Construction materials, aggregates
  - Magnesia-based binders, CO<sub>2</sub> capture storage & utilization (CCS/U)
  - Environmental applications, water purification
  - Materials chemistry, dissolution, surface interphase reactions

# The issue at hand

## Annual CO<sub>2</sub> emissions

Carbon dioxide (CO<sub>2</sub>) emissions from fossil fuels and industry<sup>1</sup>. Land use change is not included.

Source: Our World in Data based on the Global Carbon Project (2022)

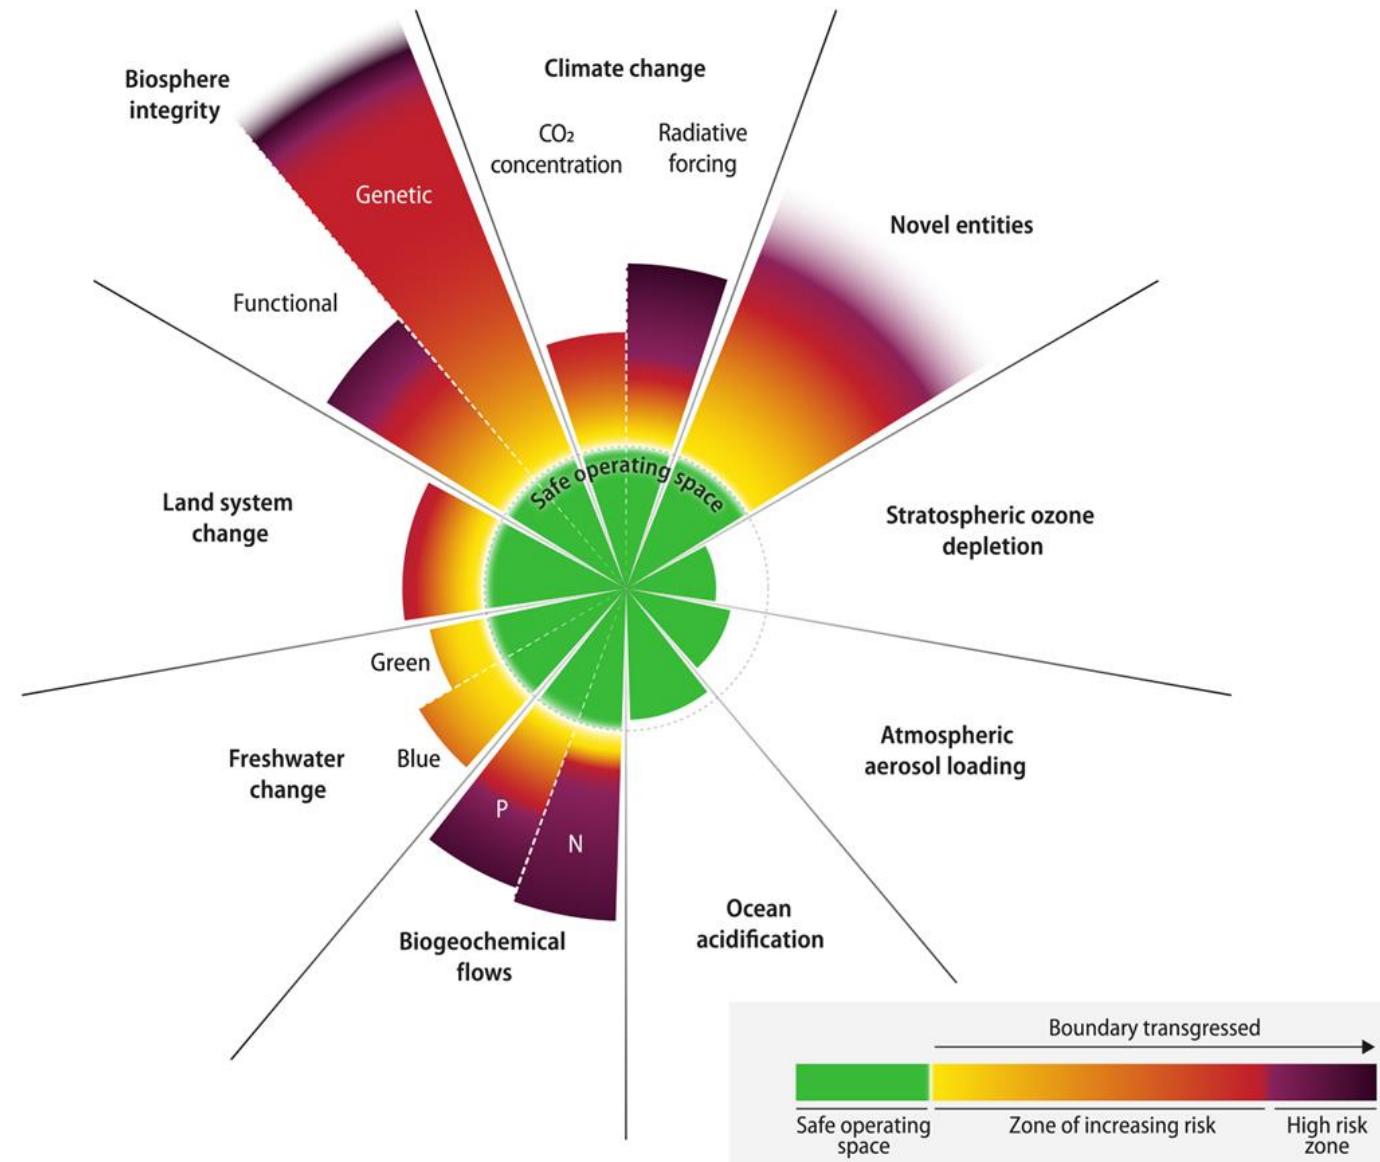

[OurWorldInData.org/co2-and-greenhouse-gas-emissions](https://OurWorldInData.org/co2-and-greenhouse-gas-emissions) • CC BY

**1. Fossil emissions:** Fossil emissions measure the quantity of carbon dioxide (CO<sub>2</sub>) emitted from the burning of fossil fuels, and directly from industrial processes such as cement and steel production. Fossil CO<sub>2</sub> includes emissions from coal, oil, gas, flaring, cement, steel, and other industrial processes. Fossil emissions do not include land use change, deforestation, soils, or vegetation.

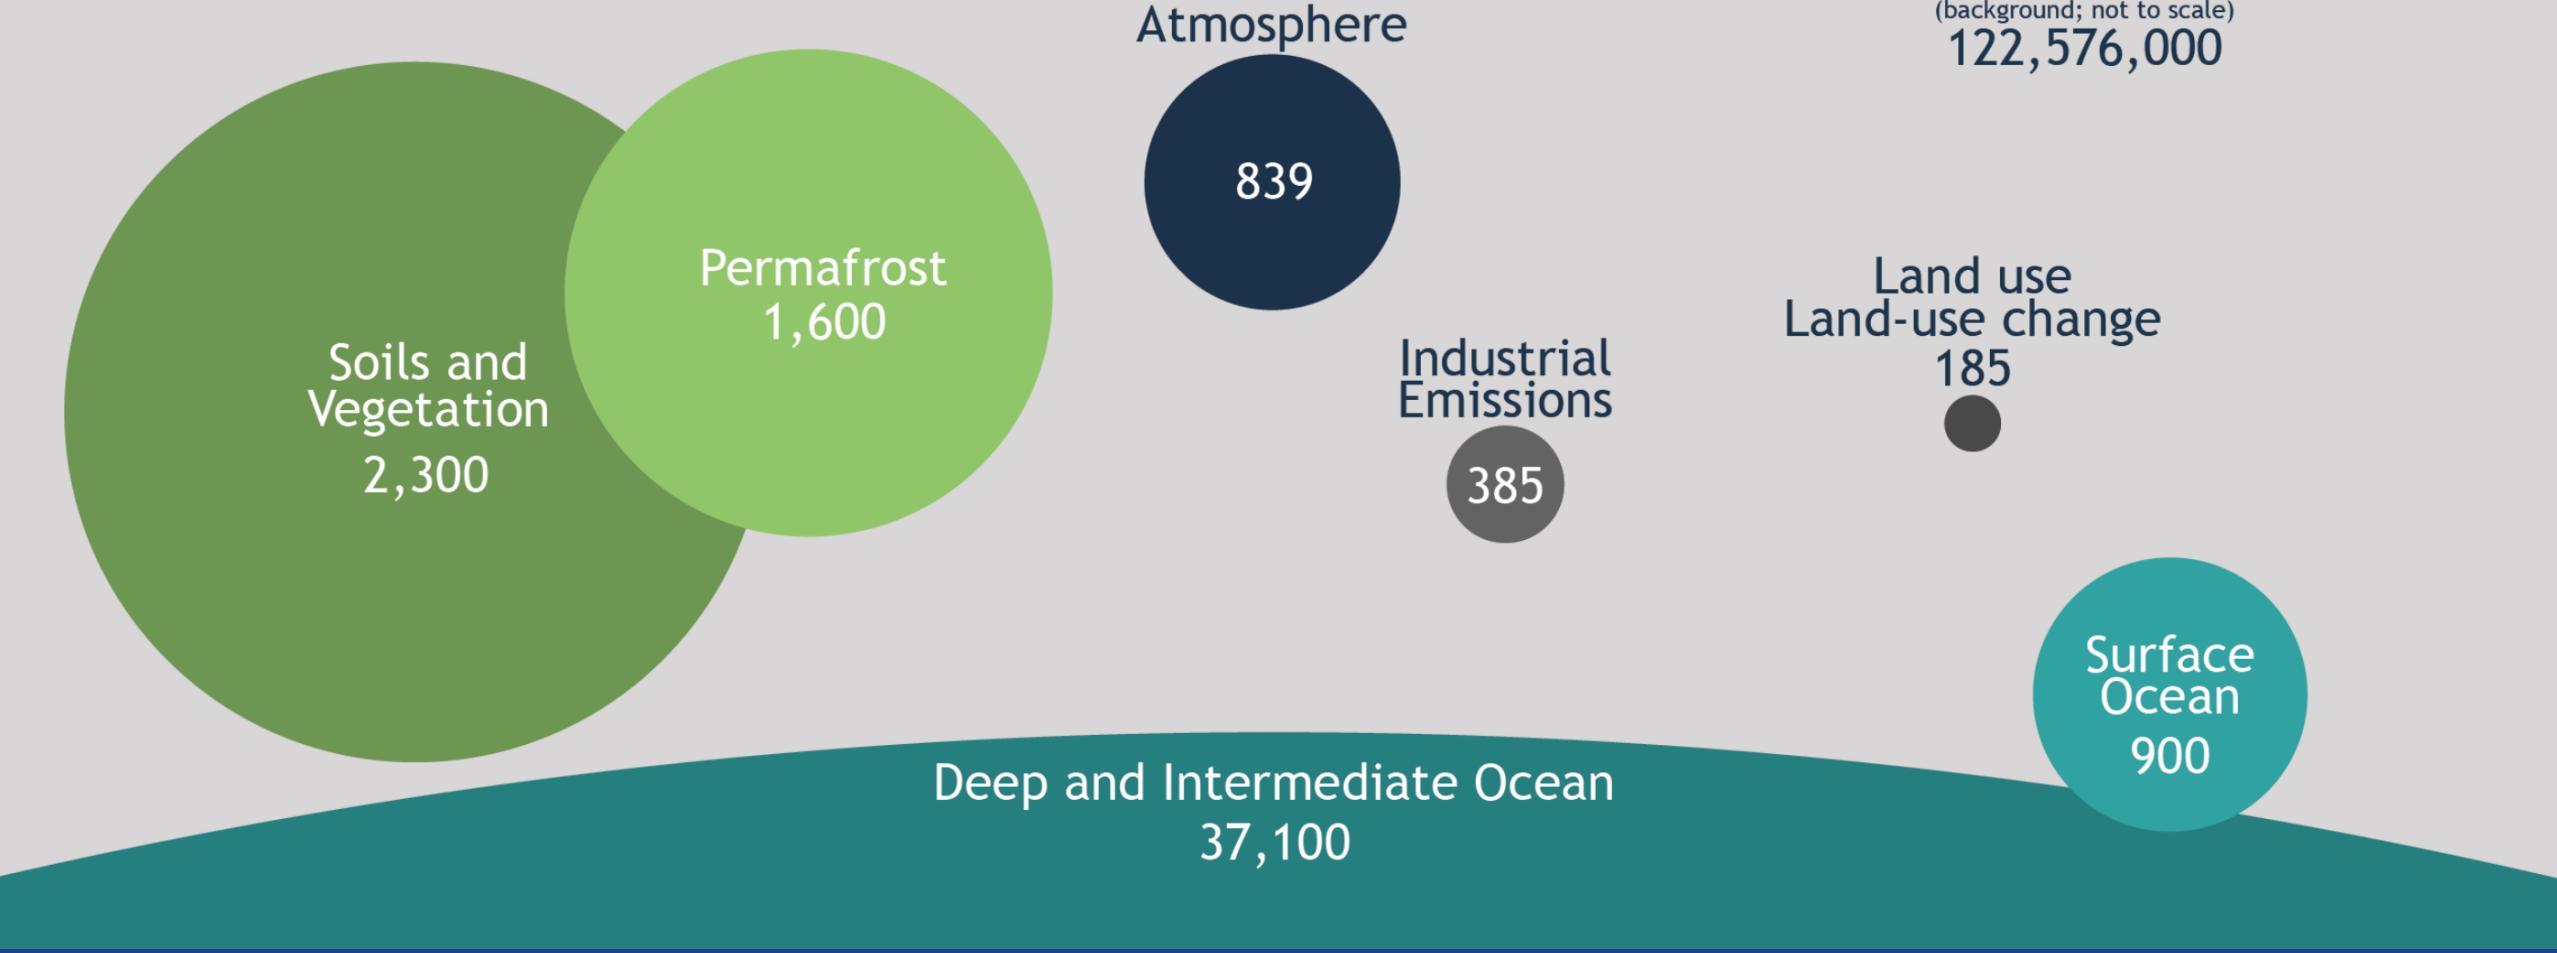

**But...  
all planetary  
boundaries  
should be  
considered**

## Planetary boundaries (situation 10/2023)

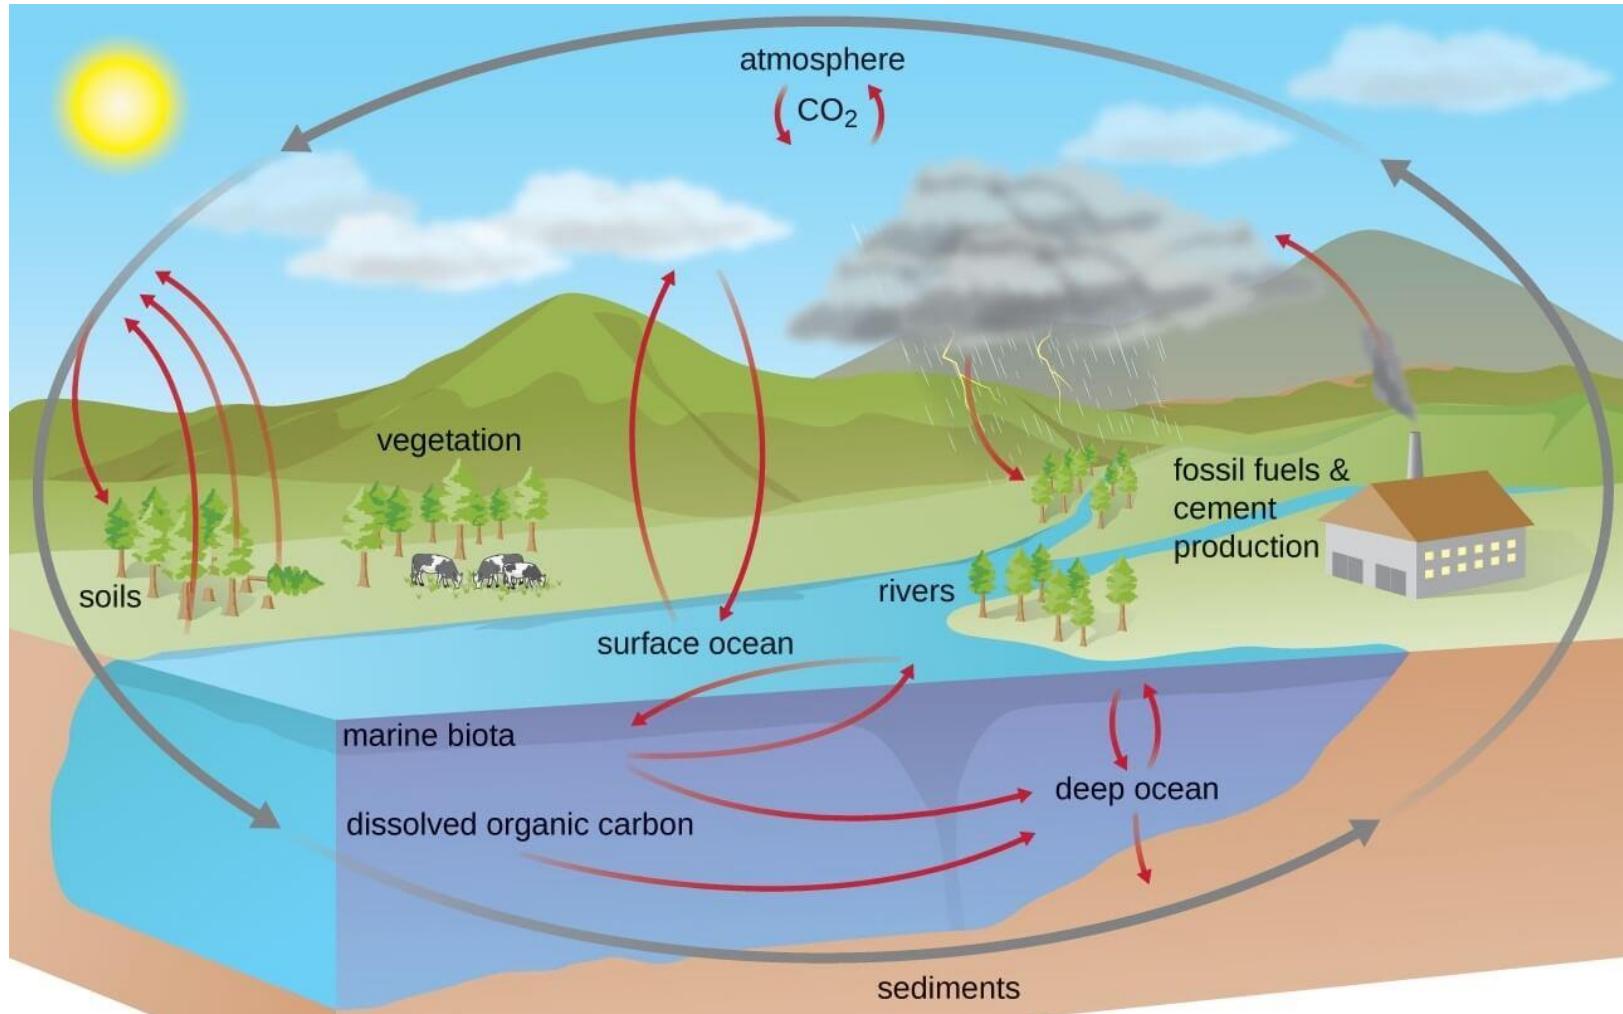

# Where's the carbon?

[doi:10.2737/WO-GTR-95](https://doi.org/10.2737/WO-GTR-95)

# Slow and fast carbon cycles

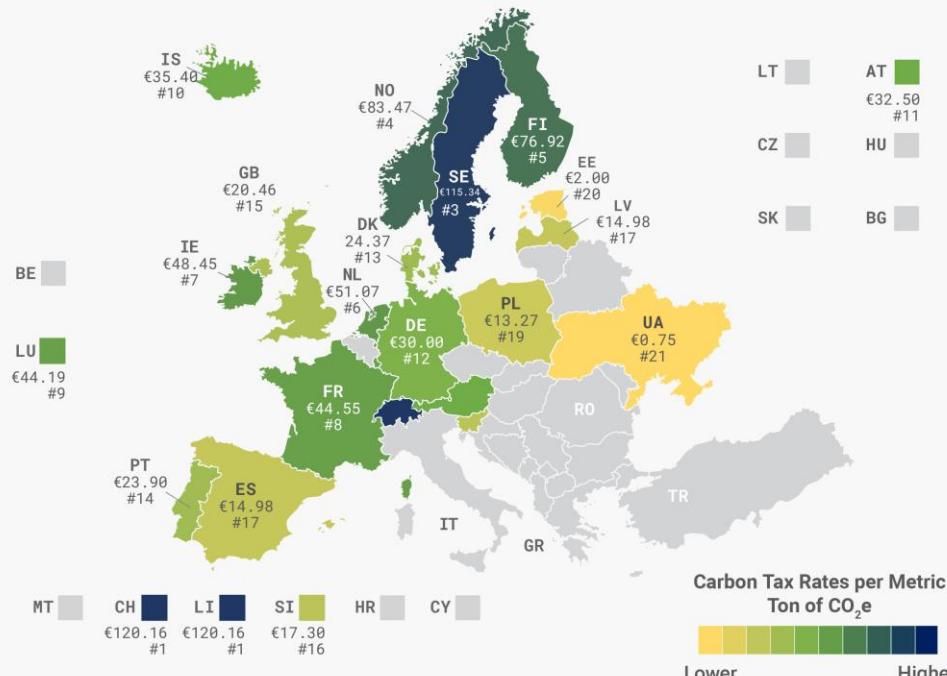

# Carbon Tax across Europe and global Carbon price trend

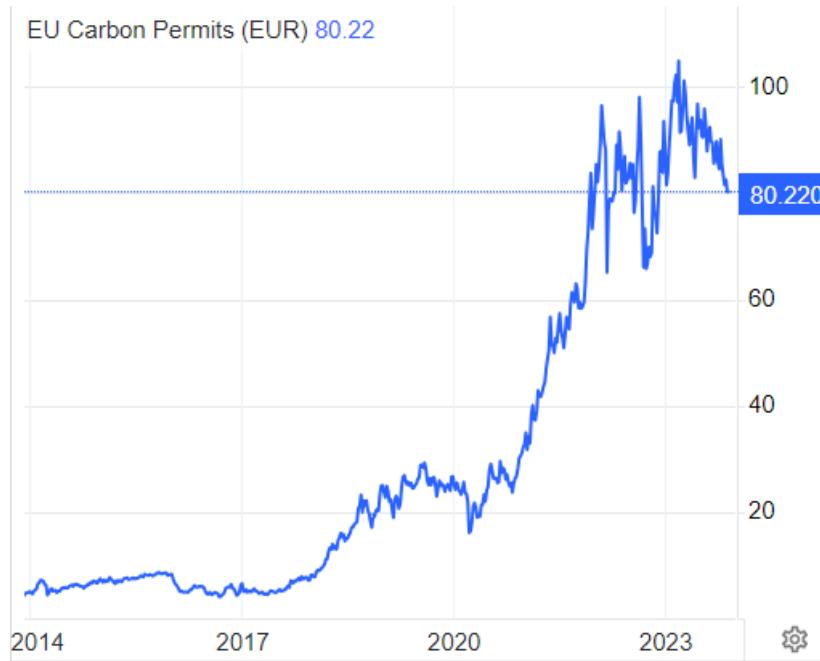

## Carbon Taxes in Europe

Carbon Tax Rates per Metric Ton of CO<sub>2</sub>e, as of March 31, 2023

Note: The carbon tax rates were converted using the EUR-USD currency conversion rate as of August 31, 2023 (USD 1 = EUR 0.9186).

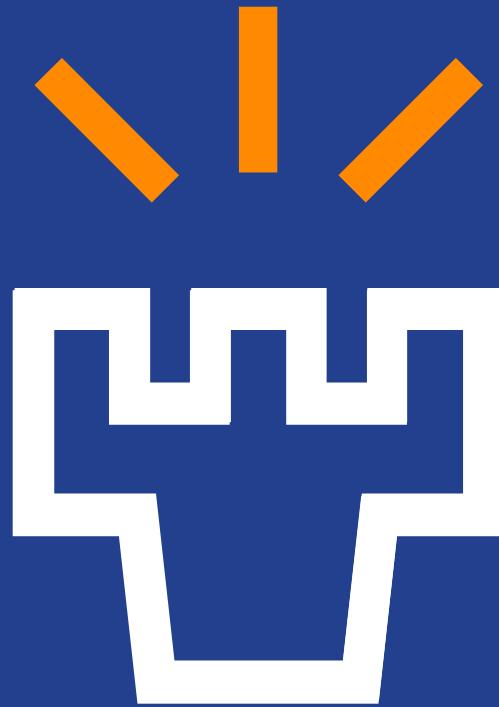

Source: World Bank, "Carbon Pricing Dashboard."

In 1990, Finland was the world's first country to introduce a carbon tax.

Now 20 EU countries have, €1-100€ /ton

Double taxation in Finland

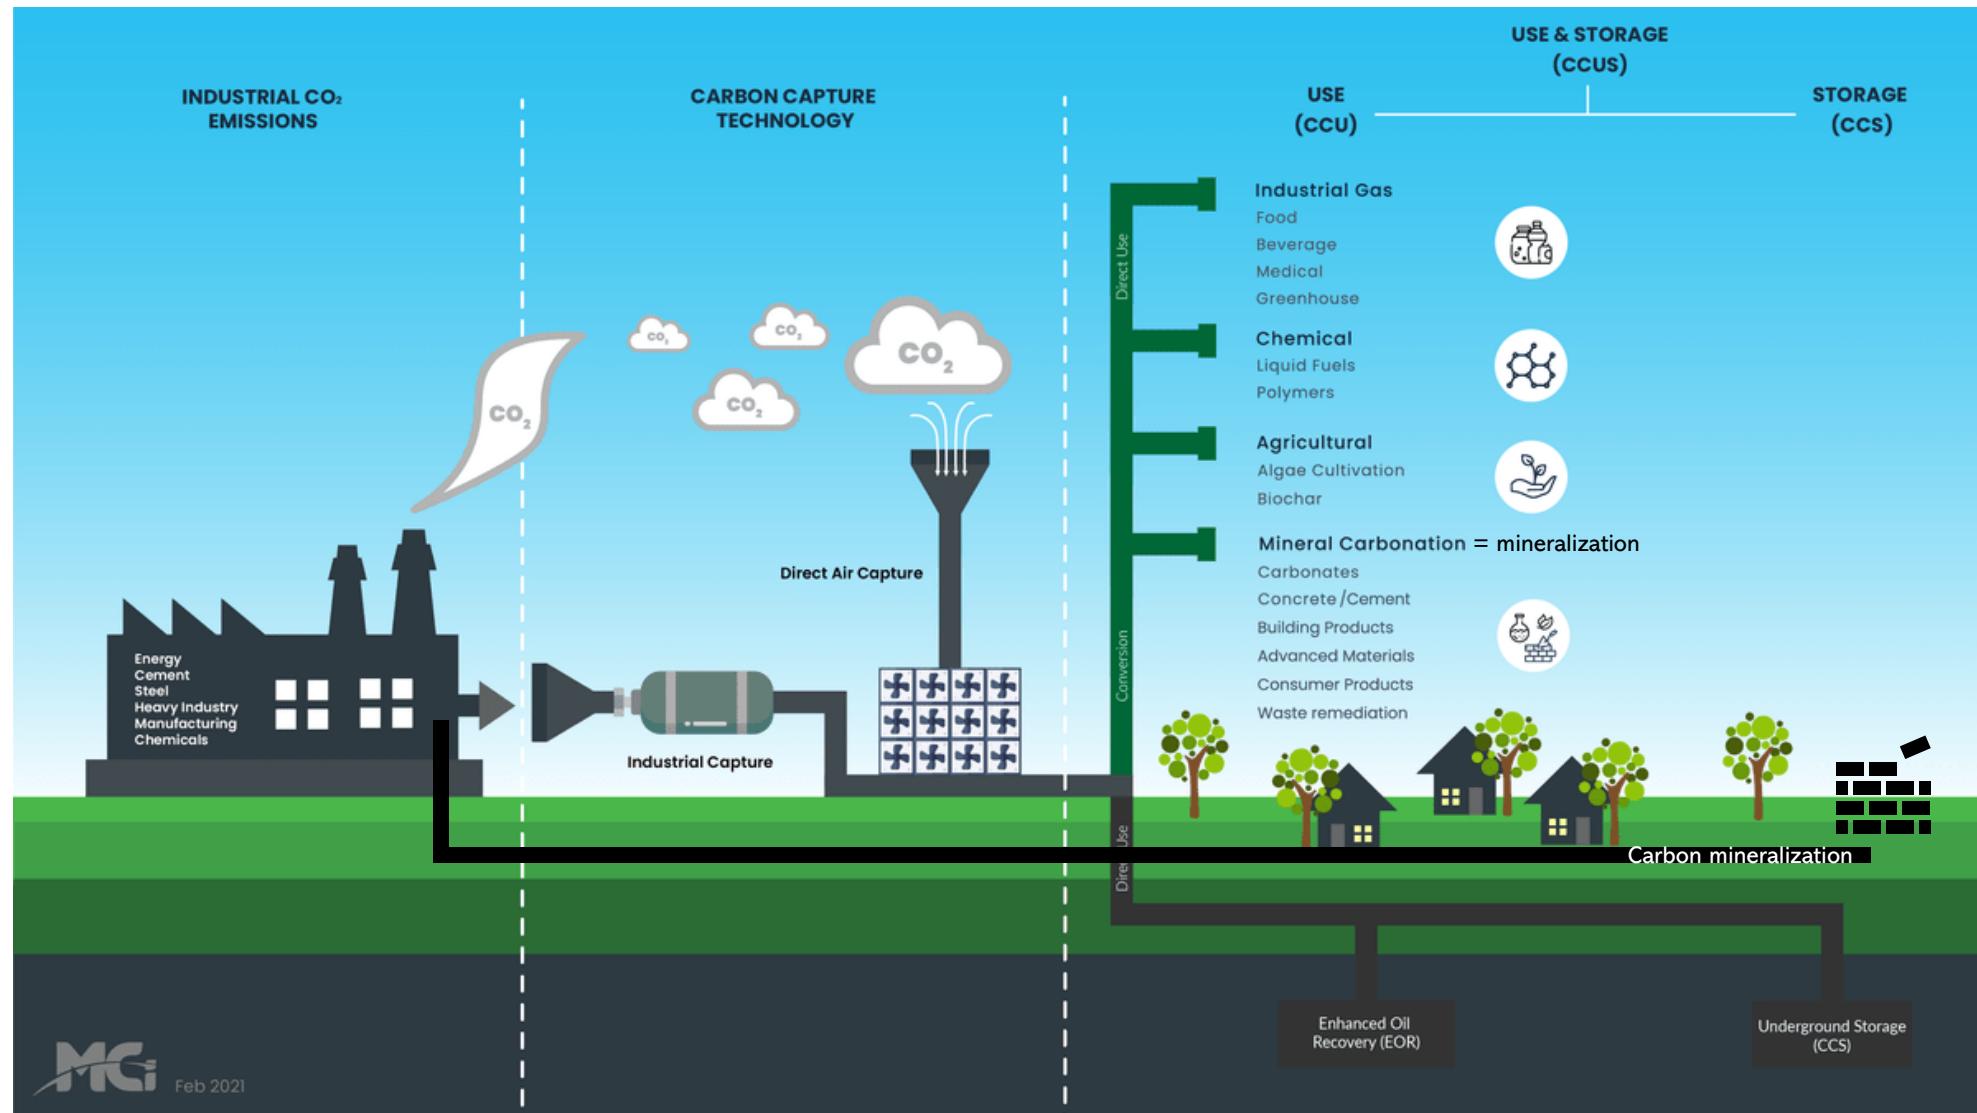

**OULUN  
YLIOPISTO**

**CCS vs. CCU**

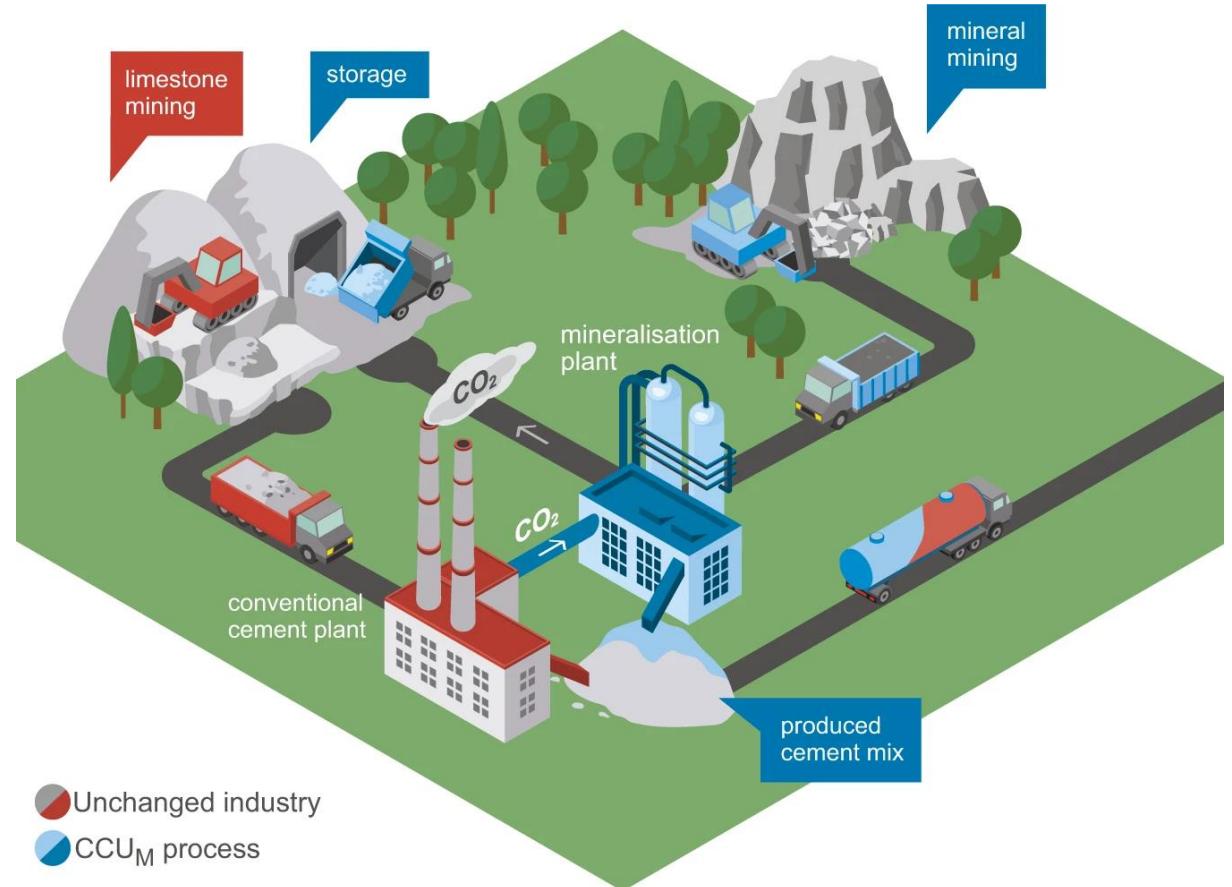

# CCUS – Carbon capture utilization and storage

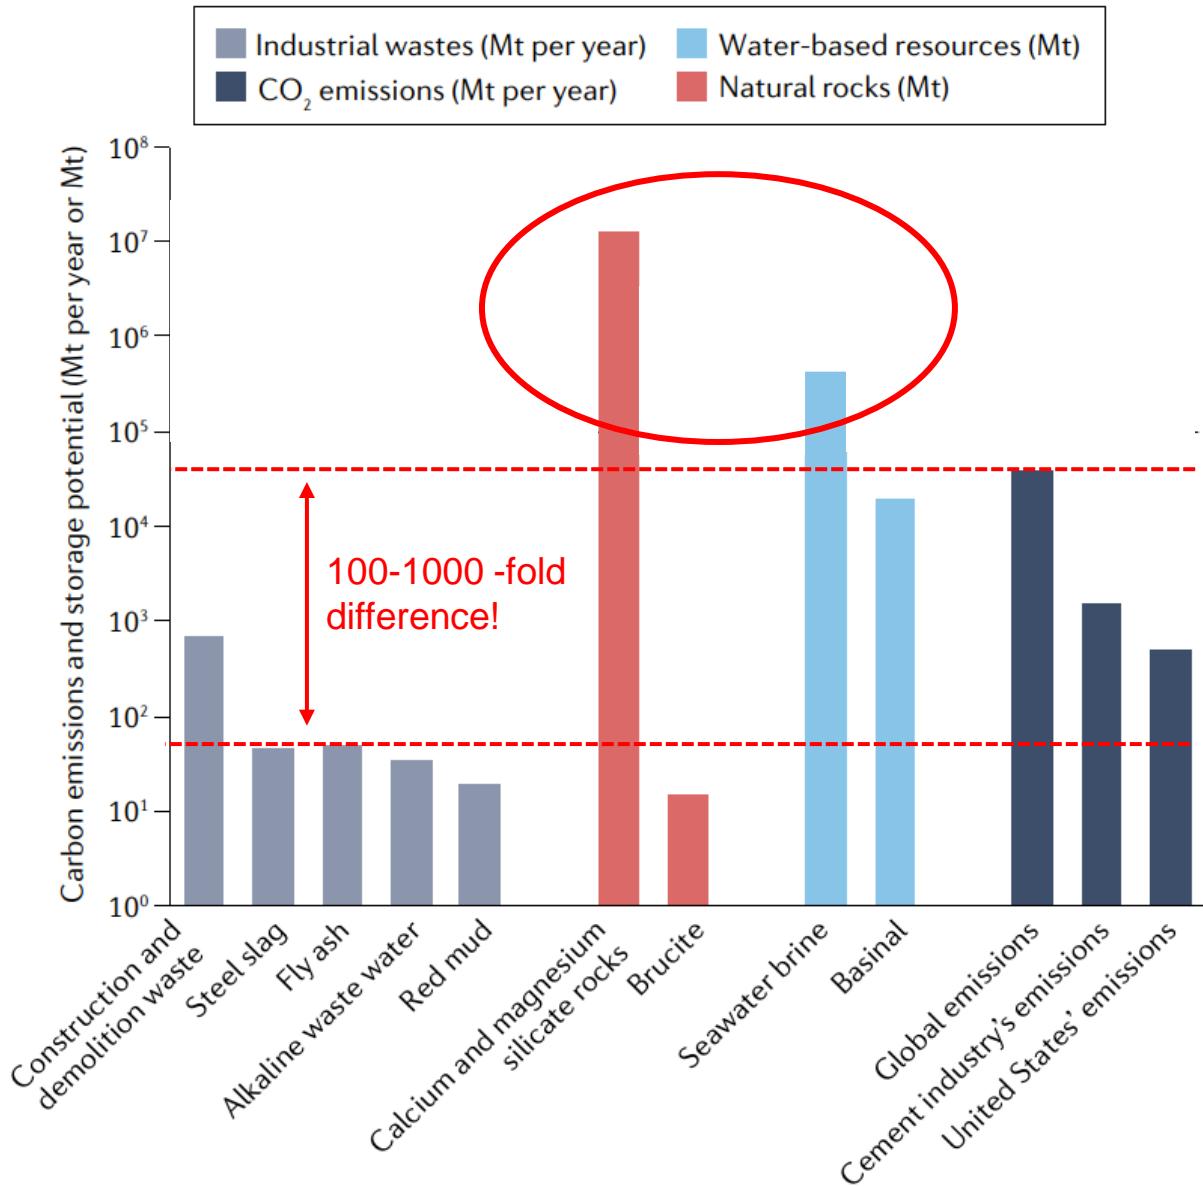

# CO<sub>2</sub> capture and utilisation through mineralisation

# Availability of minerals?

# Abundance

Abundance	CaO	MgO
Earth's crust	5%	2.9%
Earth's upper mantle	3%	38%
Slags, ashes etc.	Up to 50%	Usually <10%
Seawater	0.04%	0.13%

## - CaO

- Available primarily as  $\text{CaCO}_3$
- Also in industrial side streams

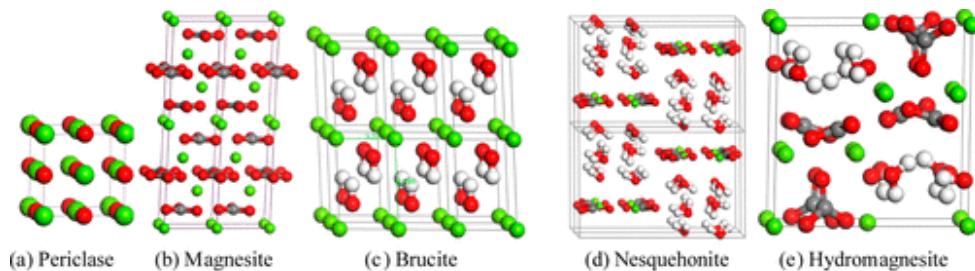

## - MgO

- Available primarily as Mg-silicates
- Not as widely distributed around the globe as  $\text{CaCO}_3$
- MgO is currently listed as critical mineral in EU (!)

# Available chemistries for MgO-based cements

<https://pubs.acs.org/doi/10.1021/jp500271n>

- Different chemistries being considered
  - Magnesium silicate hydrate (MSH)
  - Mg oxychloride (MOC) / -sulfate (MOS)
  - Mg phosphate cement
    - Competes with fertilizer feedstock (P)
  - $\text{MgCO}_3$ 
    - Needs high pressure/temperature
    - Not cohesive (cubic mineral)
- HCB –cement (Hydrous carbonate-containing brucite)
- Hydrated magnesium carbonates (HMC's)
  - Potential for carbon capture
  - Reaction rate and durability need to be improved

## Hydrated magnesium carbonates

Nesquehonite

Hydromagnesite

Dypingite

# Magnesium silicate hydrate (MSH) cements

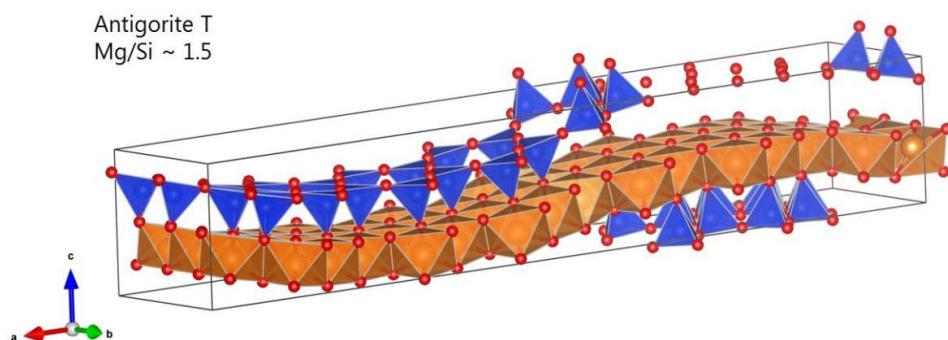

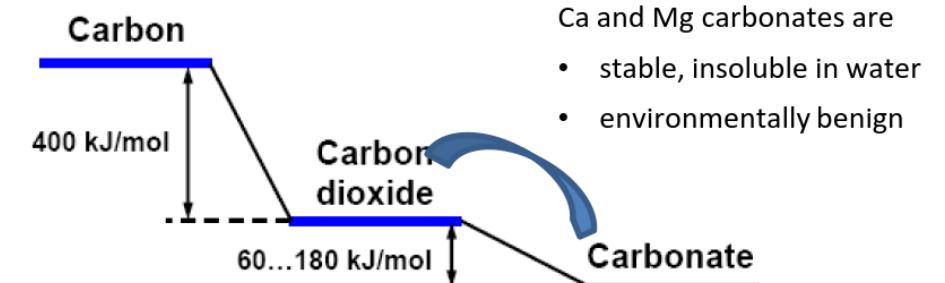

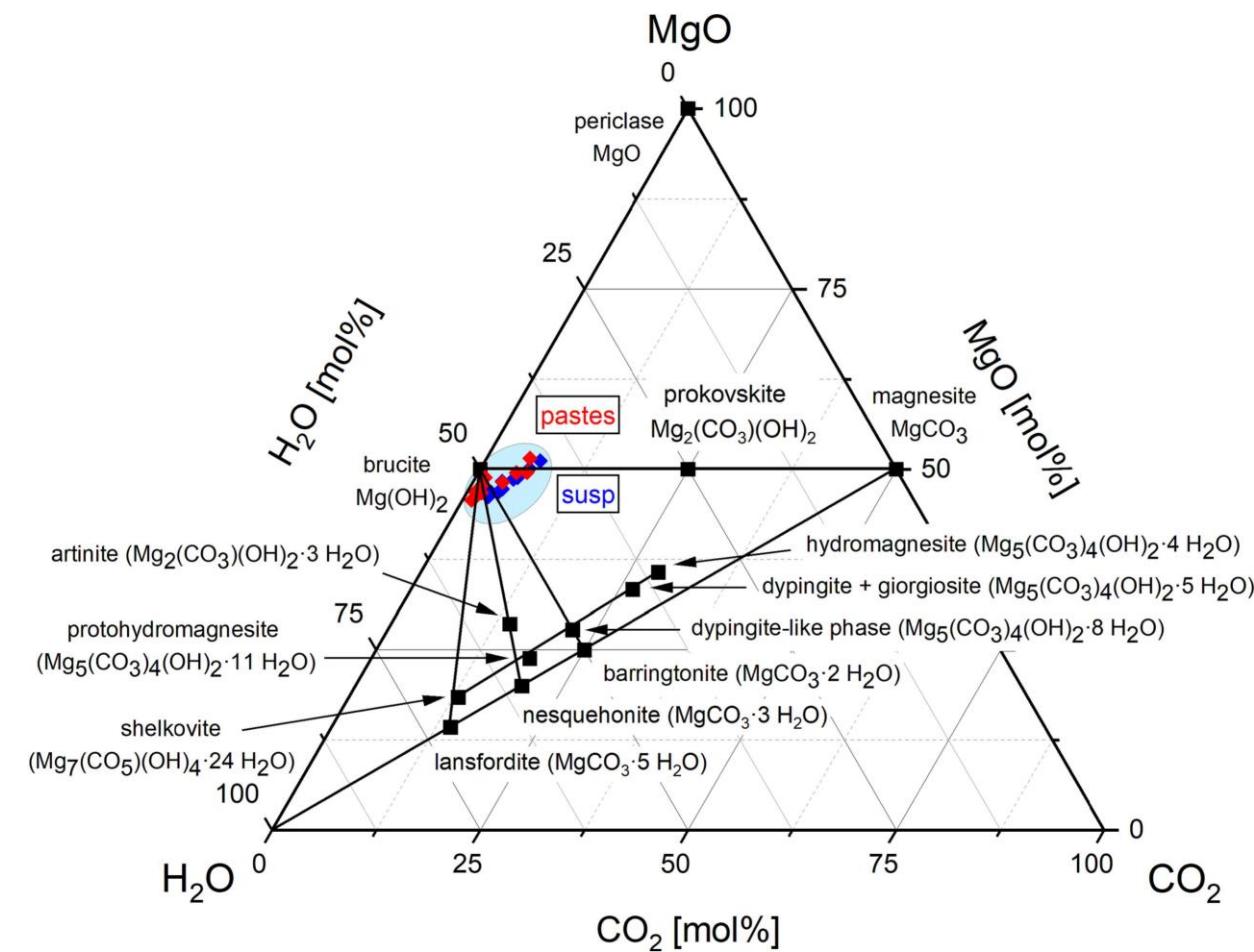

Figure 25: Schematic sketch of the structure of antigorite T (T:O structure phyllosilicate) from (Dódony et al., 2002).

- Forms by mixing MgO and SiO<sub>2</sub>
- Somewhat similar to CSH
- TRL 8-9 (?)
  
- **Advantages**
  - Carbon-neutral feedstocks available
  - Low pH compared to OPC
  - Highly durable e.g. in marine environments
  - Does not carbonate (?)
  
- **Challenges**
  - High water demand
  - No admixture development yet
  - Compatibility issues with steel reinforcement
  - MgO market/recovery technologies undeveloped

# Mg-carbonate binders

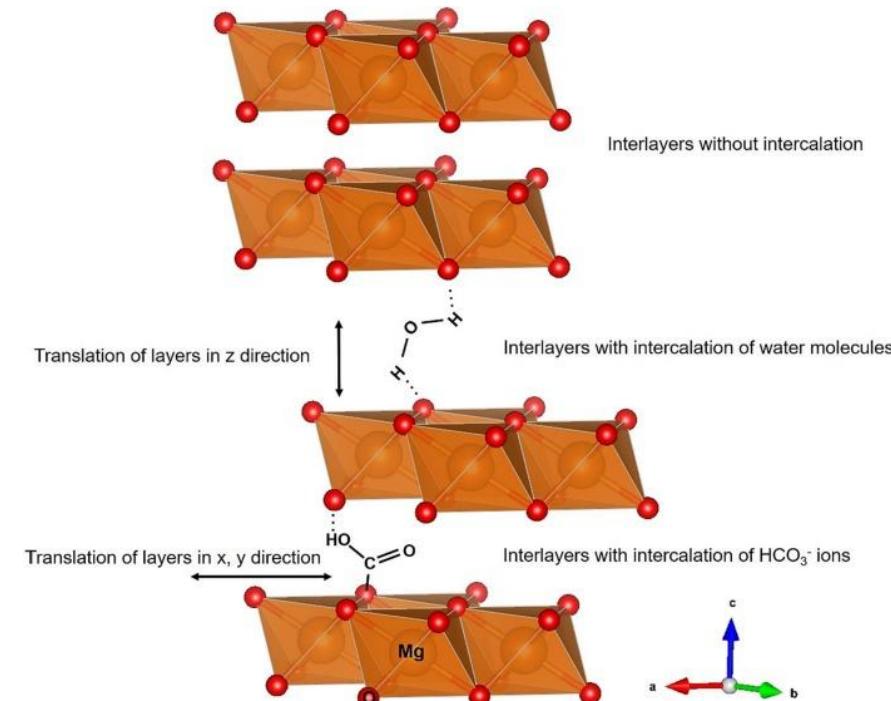

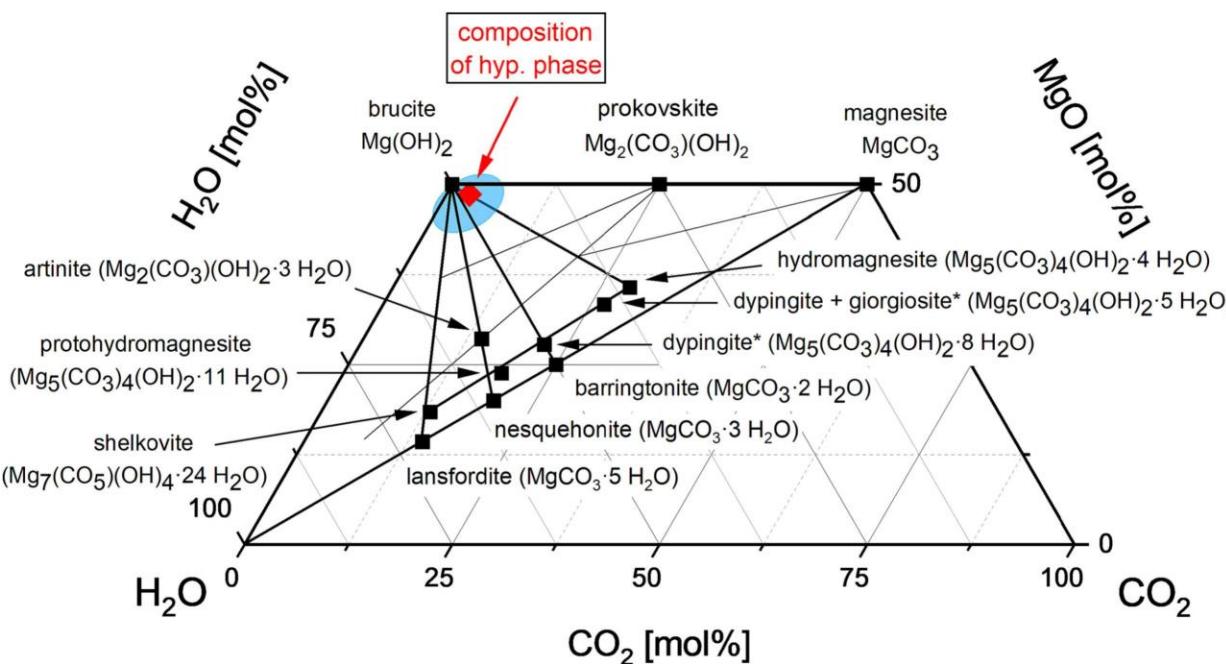

- Only magnesite ( $\text{MgCO}_3$ ) thermodynamically stable, but kinetically hindered
- Brucite (HCB) cement
- Hydrated magnesium carbonate (HMC's) binders

# HCB –cement (Hydrous carbonate-containing brucite)

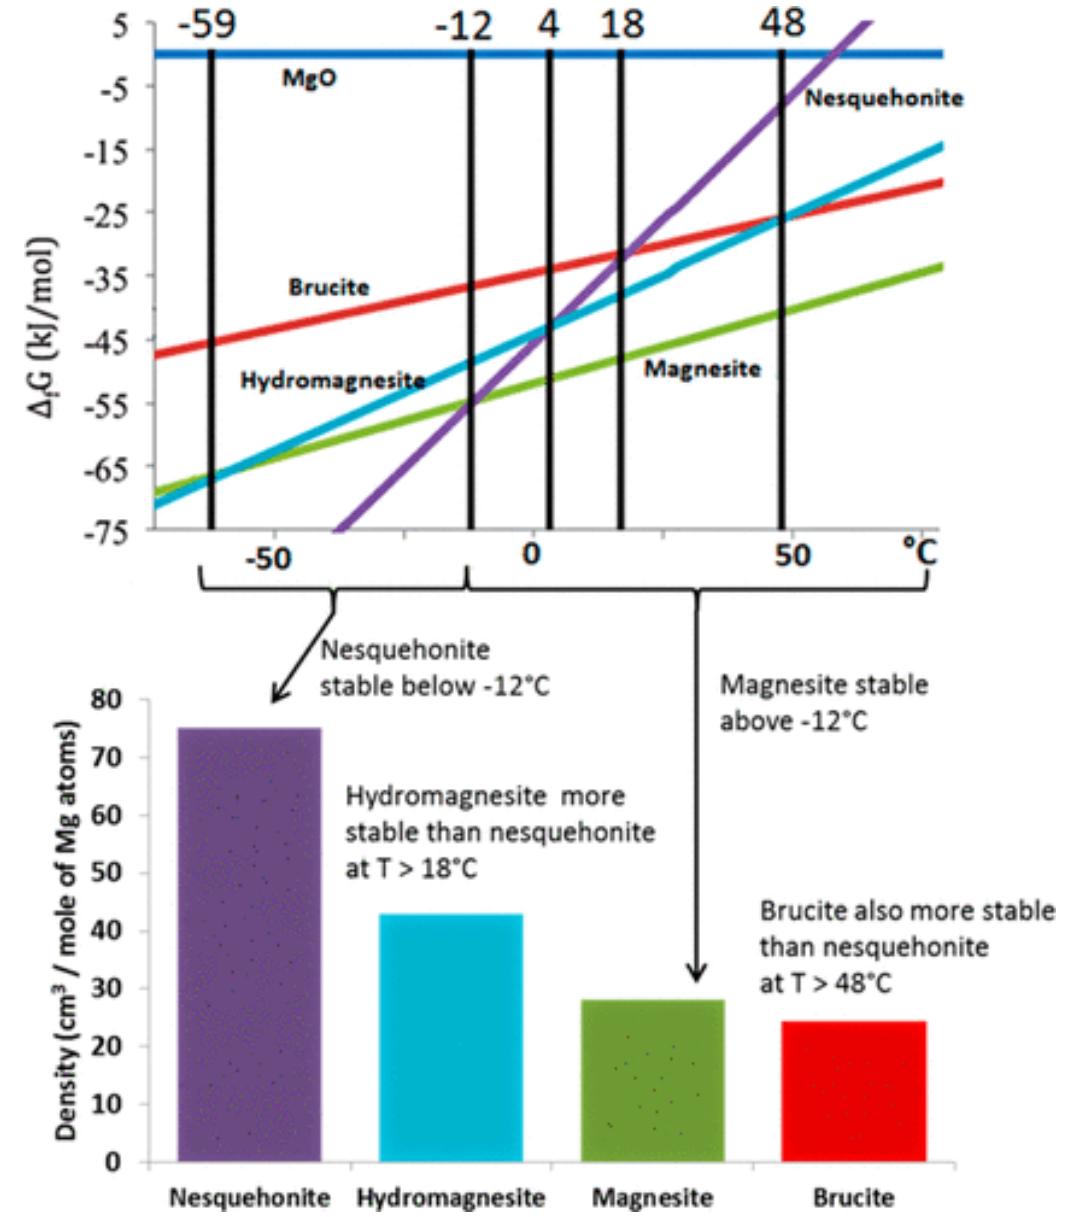

- Forms with MgO + CO<sub>2</sub> (5-10%)
- Distorted brucite [Mg(OH)<sub>2</sub>] structure
- Promising results from first concrete experiments in EMPA
- TRL 5 (?) – active area of research

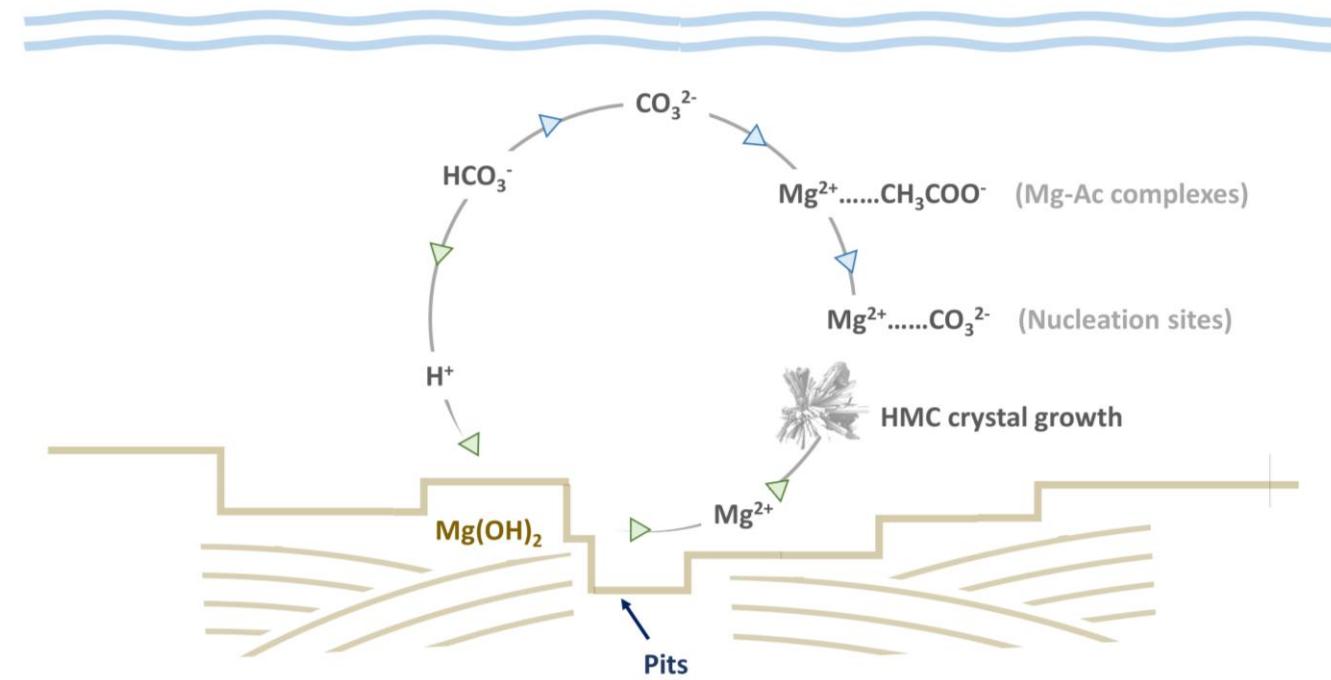

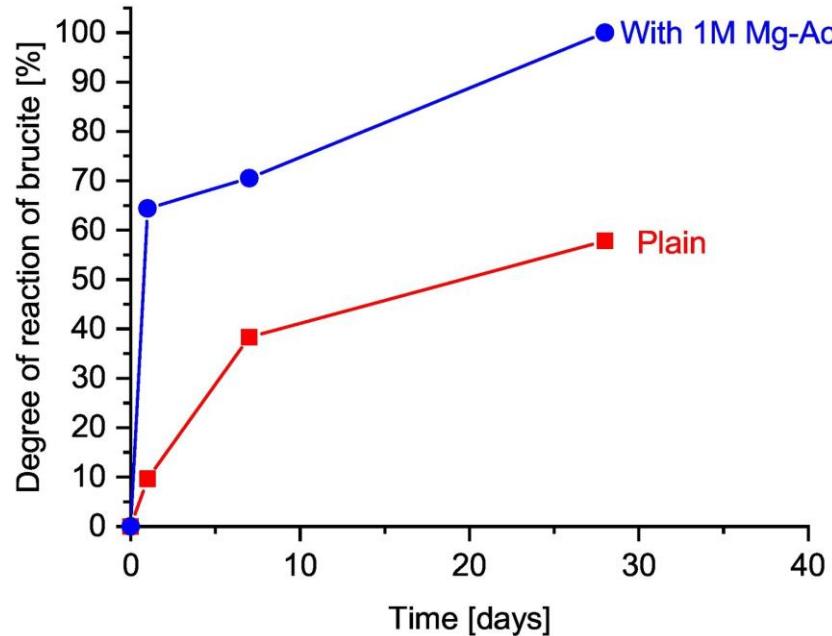

# HMC binders

- **Nesquehonite/hydromagnesite most promising**
- **However, not possible to use in conventional concrete due to low water durability**
- **Dehydrated nesquehonite functions much like gypsum**
  - Dry powder that hardens when mixed with water
  - Volumetrically stable
  - Low water durability (better than gypsum)

# Steering the carbonation kinetic and degree of $\text{Mg}(\text{OH})_2$ using organic additives

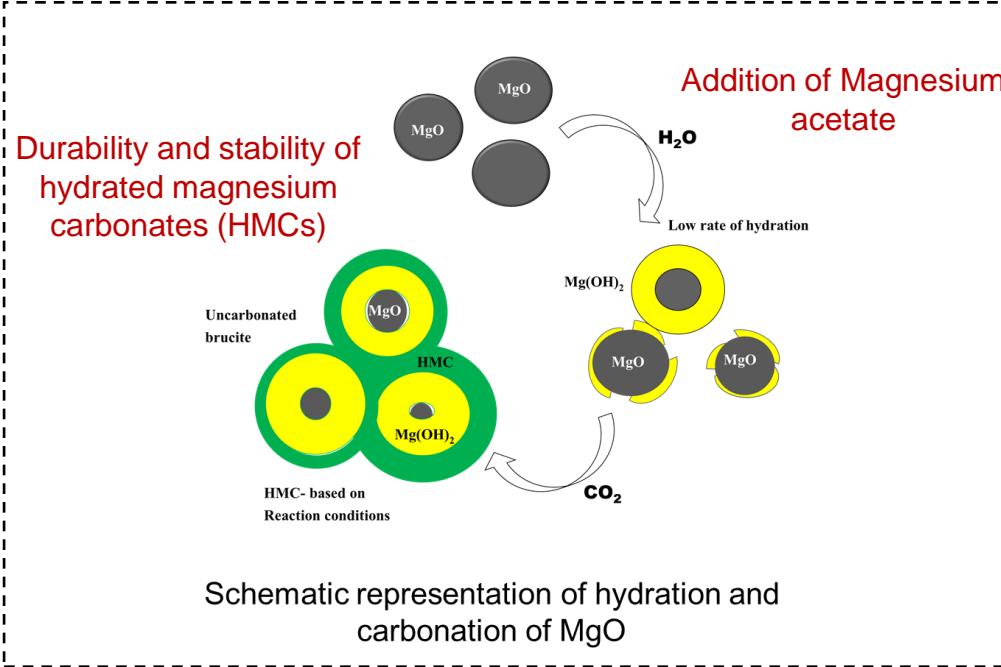

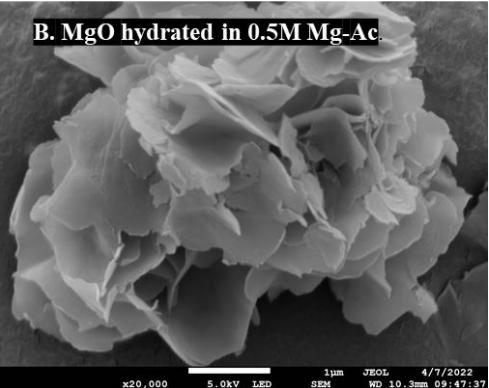

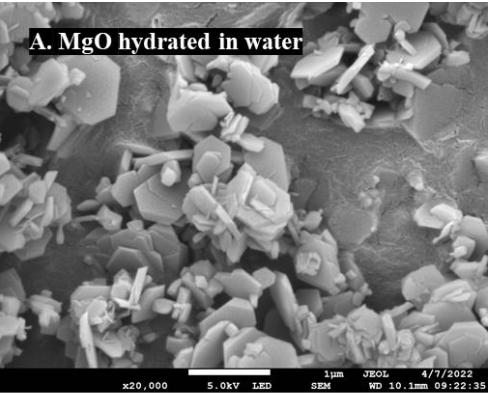

Brucite reached ca. 100% in reaction degree with the presence of Mg-acetate

<https://doi.org/10.1016/j.cemconres.2021.106696>

# An additive to influence hydration and carbonation of MgO

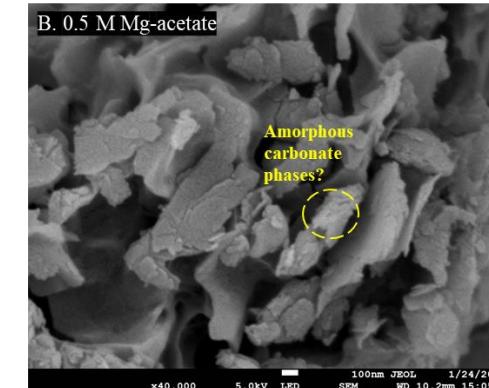

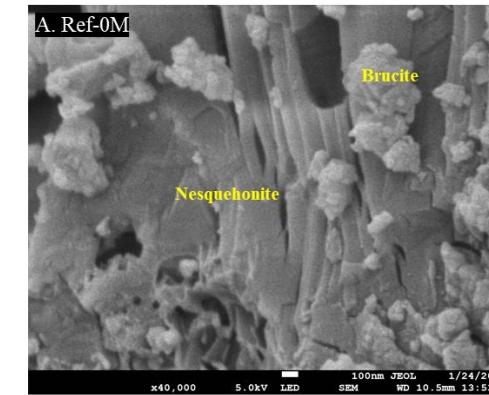

## Hydration

Mg-acetate increases the hydration kinetics and modifies the properties (morphology, crystallite size) of brucite formed

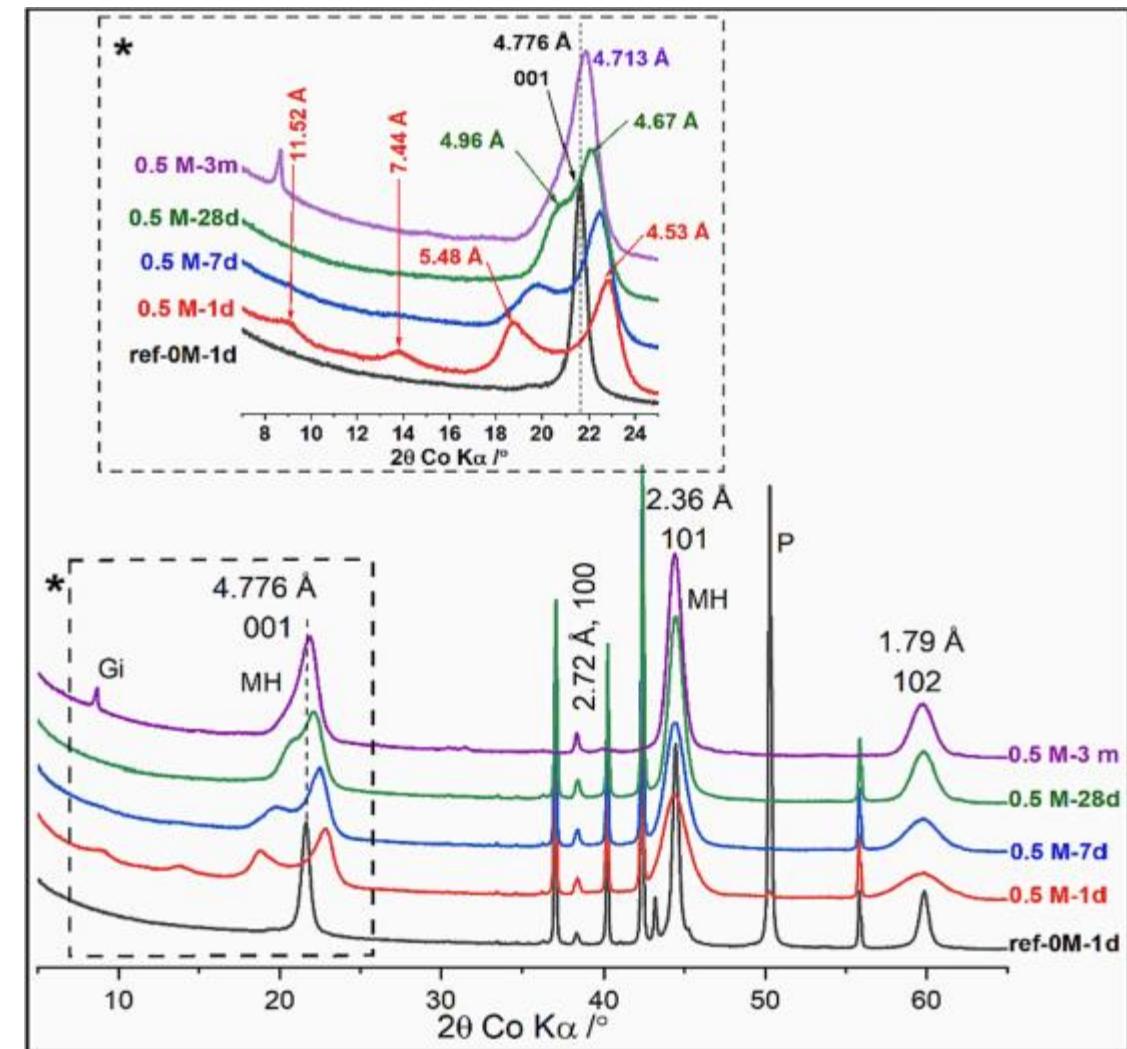

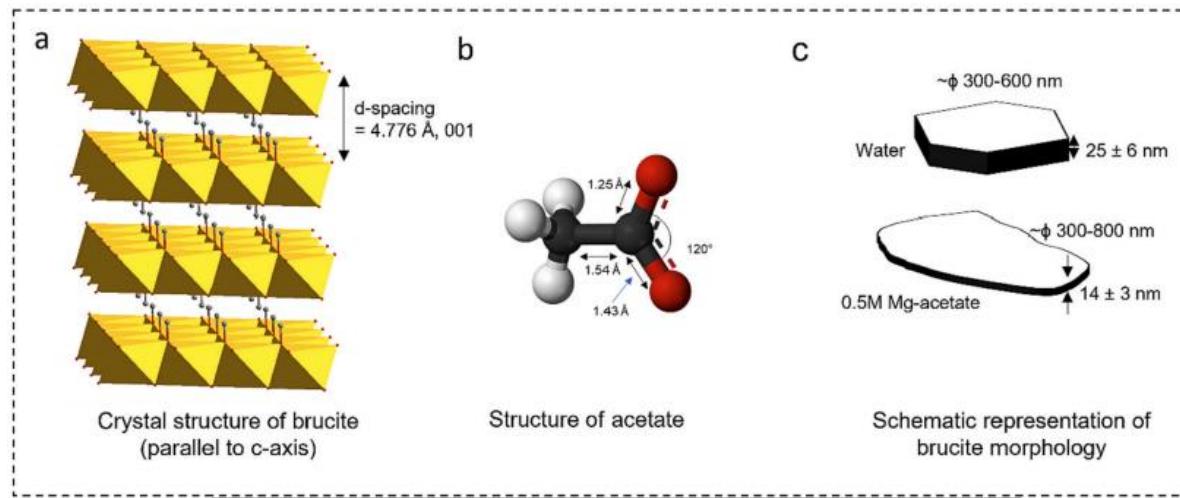

## Carbonation

Mg-acetate influences the magnesium carbonate (hydrate) formed

# Latest research

# Latest research

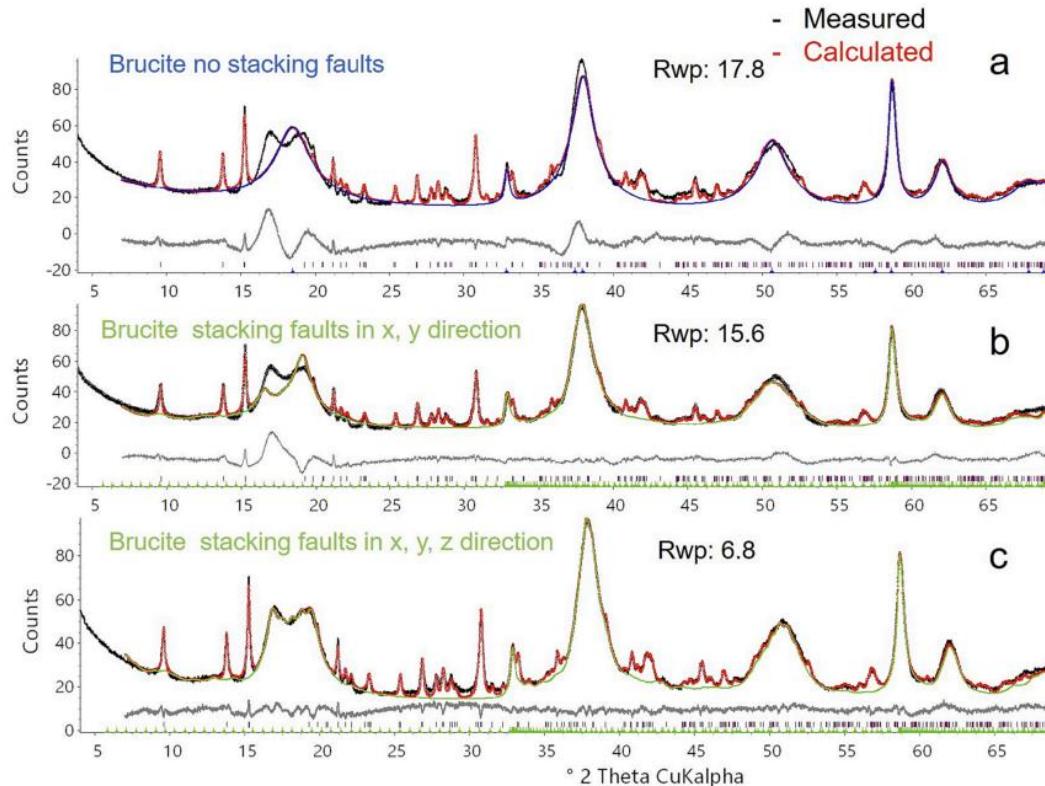

Fig. 6. Rietveld refinements of the XRD pattern of sample MgO/hydromagnesite 70/30 cured at 20 °C a) without stacking faults, b) considering stacking faults in x and y direction, and c) considering stacking faults in x, y and z direction. Rwp = weighted profile R-factor. All reflections, which are not assigned to the HCB phase (hydrated carbonate-containing brucite with stacking faults), can be assigned to the phase hydromagnesite.

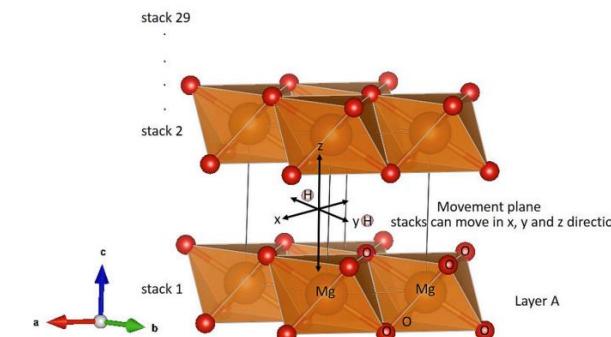

Fig. 2. Visualization of stacking layers in the brucite structure as well as movement plane and moving directions for stacking faults between repeating layer A (Visualization done using VESTA 3 [20]).

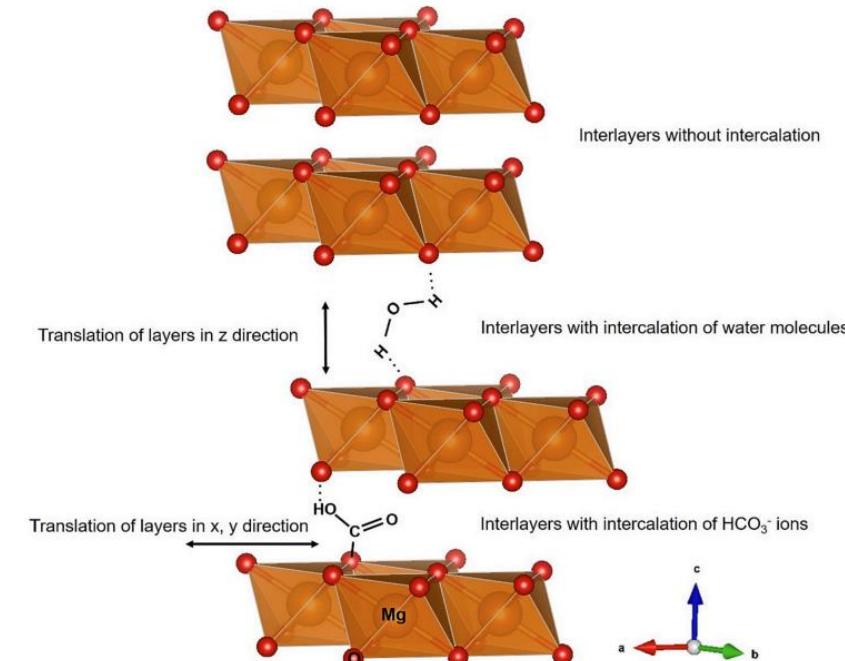

Fig. 8. Visualization of the possible brucite-like structure using VESTA 3 [20]. The possible intercalation options are shown in the figure. The sequence of the interlayers is shown as an example. The sequence in the real structure is probably an arbitrary combination of the possible interlayers.
